**Italian Space Team:
'Arivederci' SIRIO**

• Launch dream come true for scientist, IZA

By DICK BAUMBACH
Today Staff writer

Italy's first experimental communications satellite, SIRIO, soared into the twilight sky at 7:50 p.m. Thursday from Cape Canaveral Air Force Station.

The \$100 million space package was funded by the Italian government, with support activities provided by NASA.

As the Delta rocket carrying SIRIO lifted off from Air Force station a bright yellow flame shot out of the study of Super High Frequency (SHF) radio waves included in the study is during adverse weather conditions, such as snow.

The testing of the SHF waves is becoming necessary because of overcrowding on conventional frequency bands, such as the Ultra High Frequency (UHF) level.

From its initial on-station position SIRIO will transmit voice, data and television communications in the SHF range from Europe to North America.
