BRAIN Signs

Human factors in aerospace: why and how to measure them

Prof. Fabio Babiloni

Dept. Molecular Medicine, Univ. Sapienza,
Rome, Italy
CSO of BrainSigns, Rome, Italy

Mindtooth project has received
funding from the European Union's
Horizon 2020 research and innovation
programme

What are the human factors (HF) ?

- ATTENTION
- STRESS
- MENTAL FATIGUE
- SITUATION AWARENESS
- EMOTION

Why it is so important to measure HF

- Over **1.2 million people die each year on the world's roads**, with millions more sustaining serious injuries and living with long-term adverse health consequences. **Human error is the main cause** of the 57 % of road accidents and a contributing factor in over 90 % of them.
- More than **70% of aviation accidents are due to human errors**, most of them caused by pilots' overload or mental status impairment.
- **Medical errors cause high people mortality**, about 100.000 people per year. Furthermore, about the 10 % of hospitalized patients experienced complications on their treatments due to medical mistakes.

The Human Factor is the most important but the less controllable factor in operational environments.

(Boeing Report, 2011), (Feyer and Williamson, 2011), (WHO Report, 2015)

Why it is so important to measure HF in space?

- It has been suggested that variation of gravity from 1g generated temporary diminution of decision-making capabilities in astronauts.
- Distribution of fluids impairs the regular cerebral rhythms in EEG on astronauts.
- For long term missions while the psychologic tests have been already attempted in the field, trainers still waiting a device able to measure **objectively** such human factors in **real time**.

BIOSIGNALS

**OPERATOR'S
PSYCHOPHYSIOLOGICAL STATE**

Neurophysiological metrics of Human Factor Components

NEUROMETRICS

Indexes based on neurophysiological signals

SAPIENZA
UNIVERSITÀ DI ROMA

How to do that in real environments: the two needed advancements

- **1) To realize portable and easy-to-use** cerebral measurements devices to be used during training without interfere with normal practices
- **2) To measure** efficiently and in a scientific way the main neuro-metrics associated with relevant mental states (e.g. stress, mental workload, etc).

With whom the research have been made: science and technologies have been developed with different aeronautic partners along a decade

What We Achieved So Far

Methodologies for:

- Training assessment
- Skill level (S-R-K model) assessment
- Mental states evaluation
- Systems testing and comparison
- Cooperation between brains (CRM\TRM)
- Adaptive Automations

Tested ON:

- Professional a/c commercial and military pilots
(total sample size 45 users)
- Professional helicopters military pilots
(total sample size 5 users)
- ATCOs professional and students
(more than 100 users)
- Car drivers
(total sample size 70 users)
- Surgeons
(total sample size 30 users)
- Sky Divers
(total sample size 12 users)

MINDTOOTH project: Pilot experiment URBE

Collaboration with UrbeAero for the design and validation of an EEG headset specific for Aviation contexts within the MINDTOOTH project (GA 950998)

Workload index correlation during workload scenario for expert and novice pilots

- ✓ The workload neurometric is correlated with behavioural index assessed by the trainers

Estimation of stress induced by dangerous situation in a pilot during airflight simulation

Cruise Flight

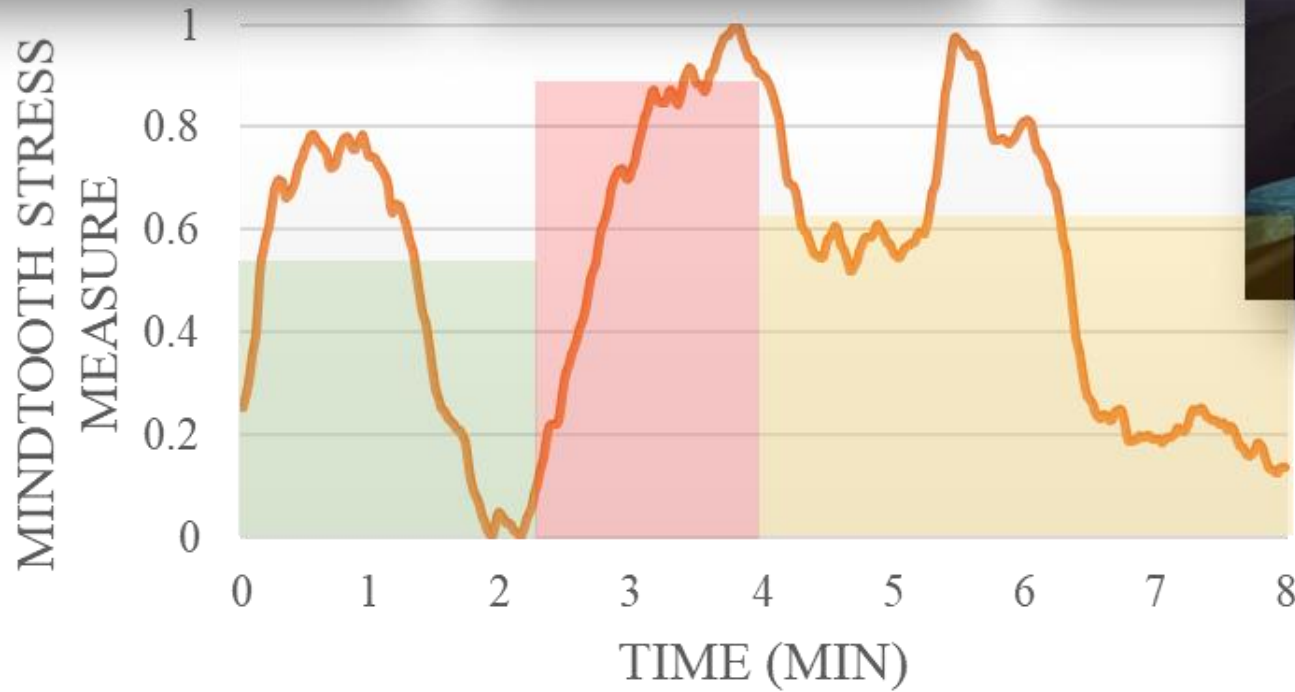

APU Fire

May-day & Landing

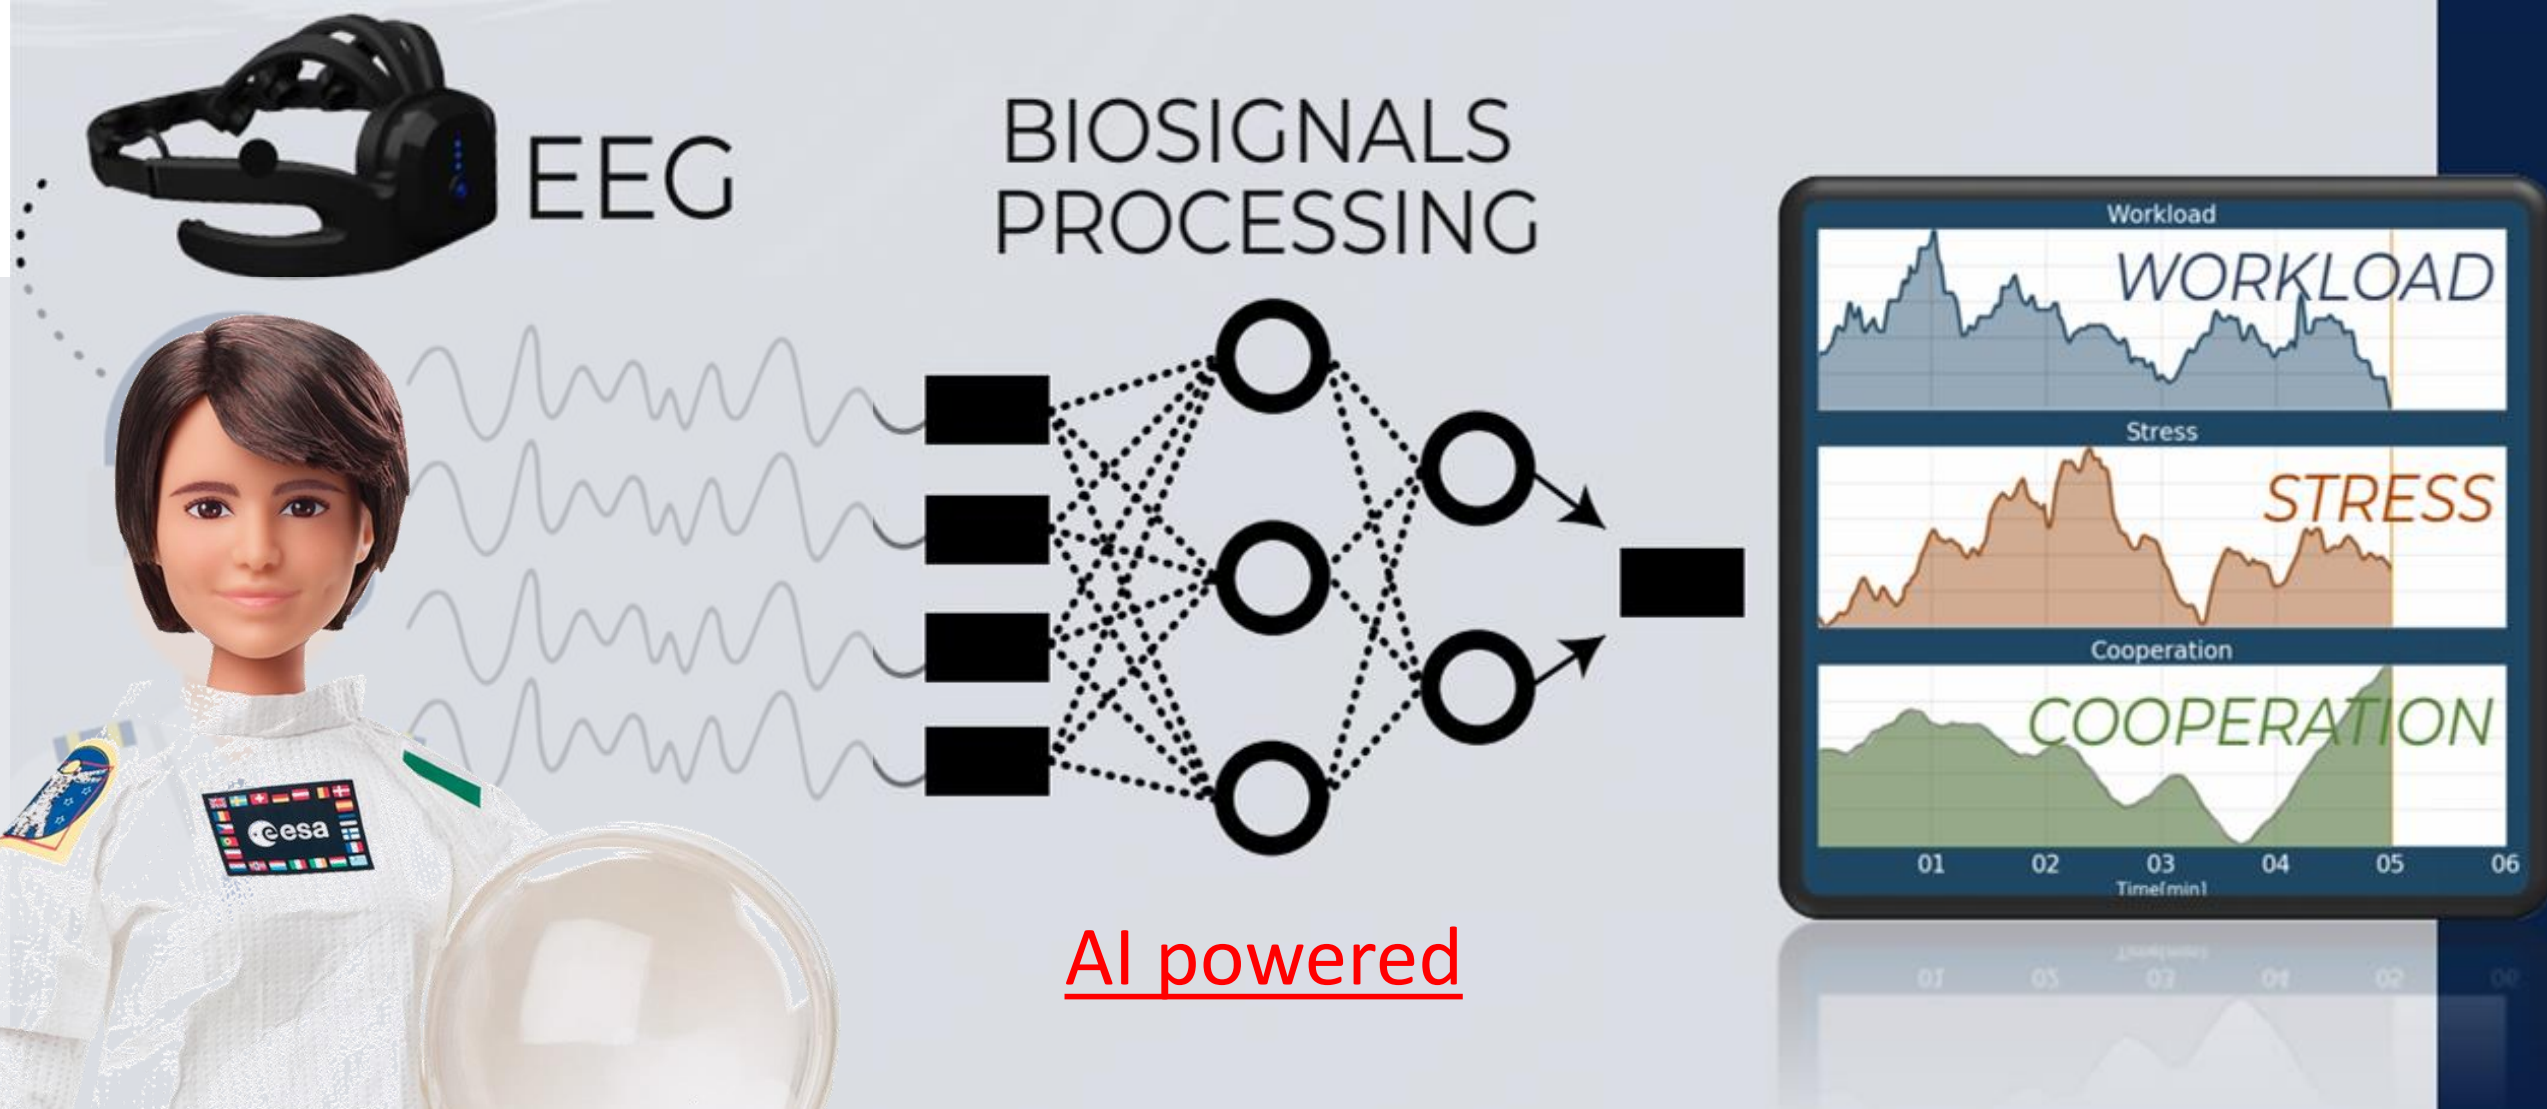

MAY-DAY!
MAY-DAY!

✓ The Mindtooth Stress measure allows the identification of stressful behaviours

The extension of neurometrics to space flights is then straightforward (Virgin Galactic flight in May 2023)

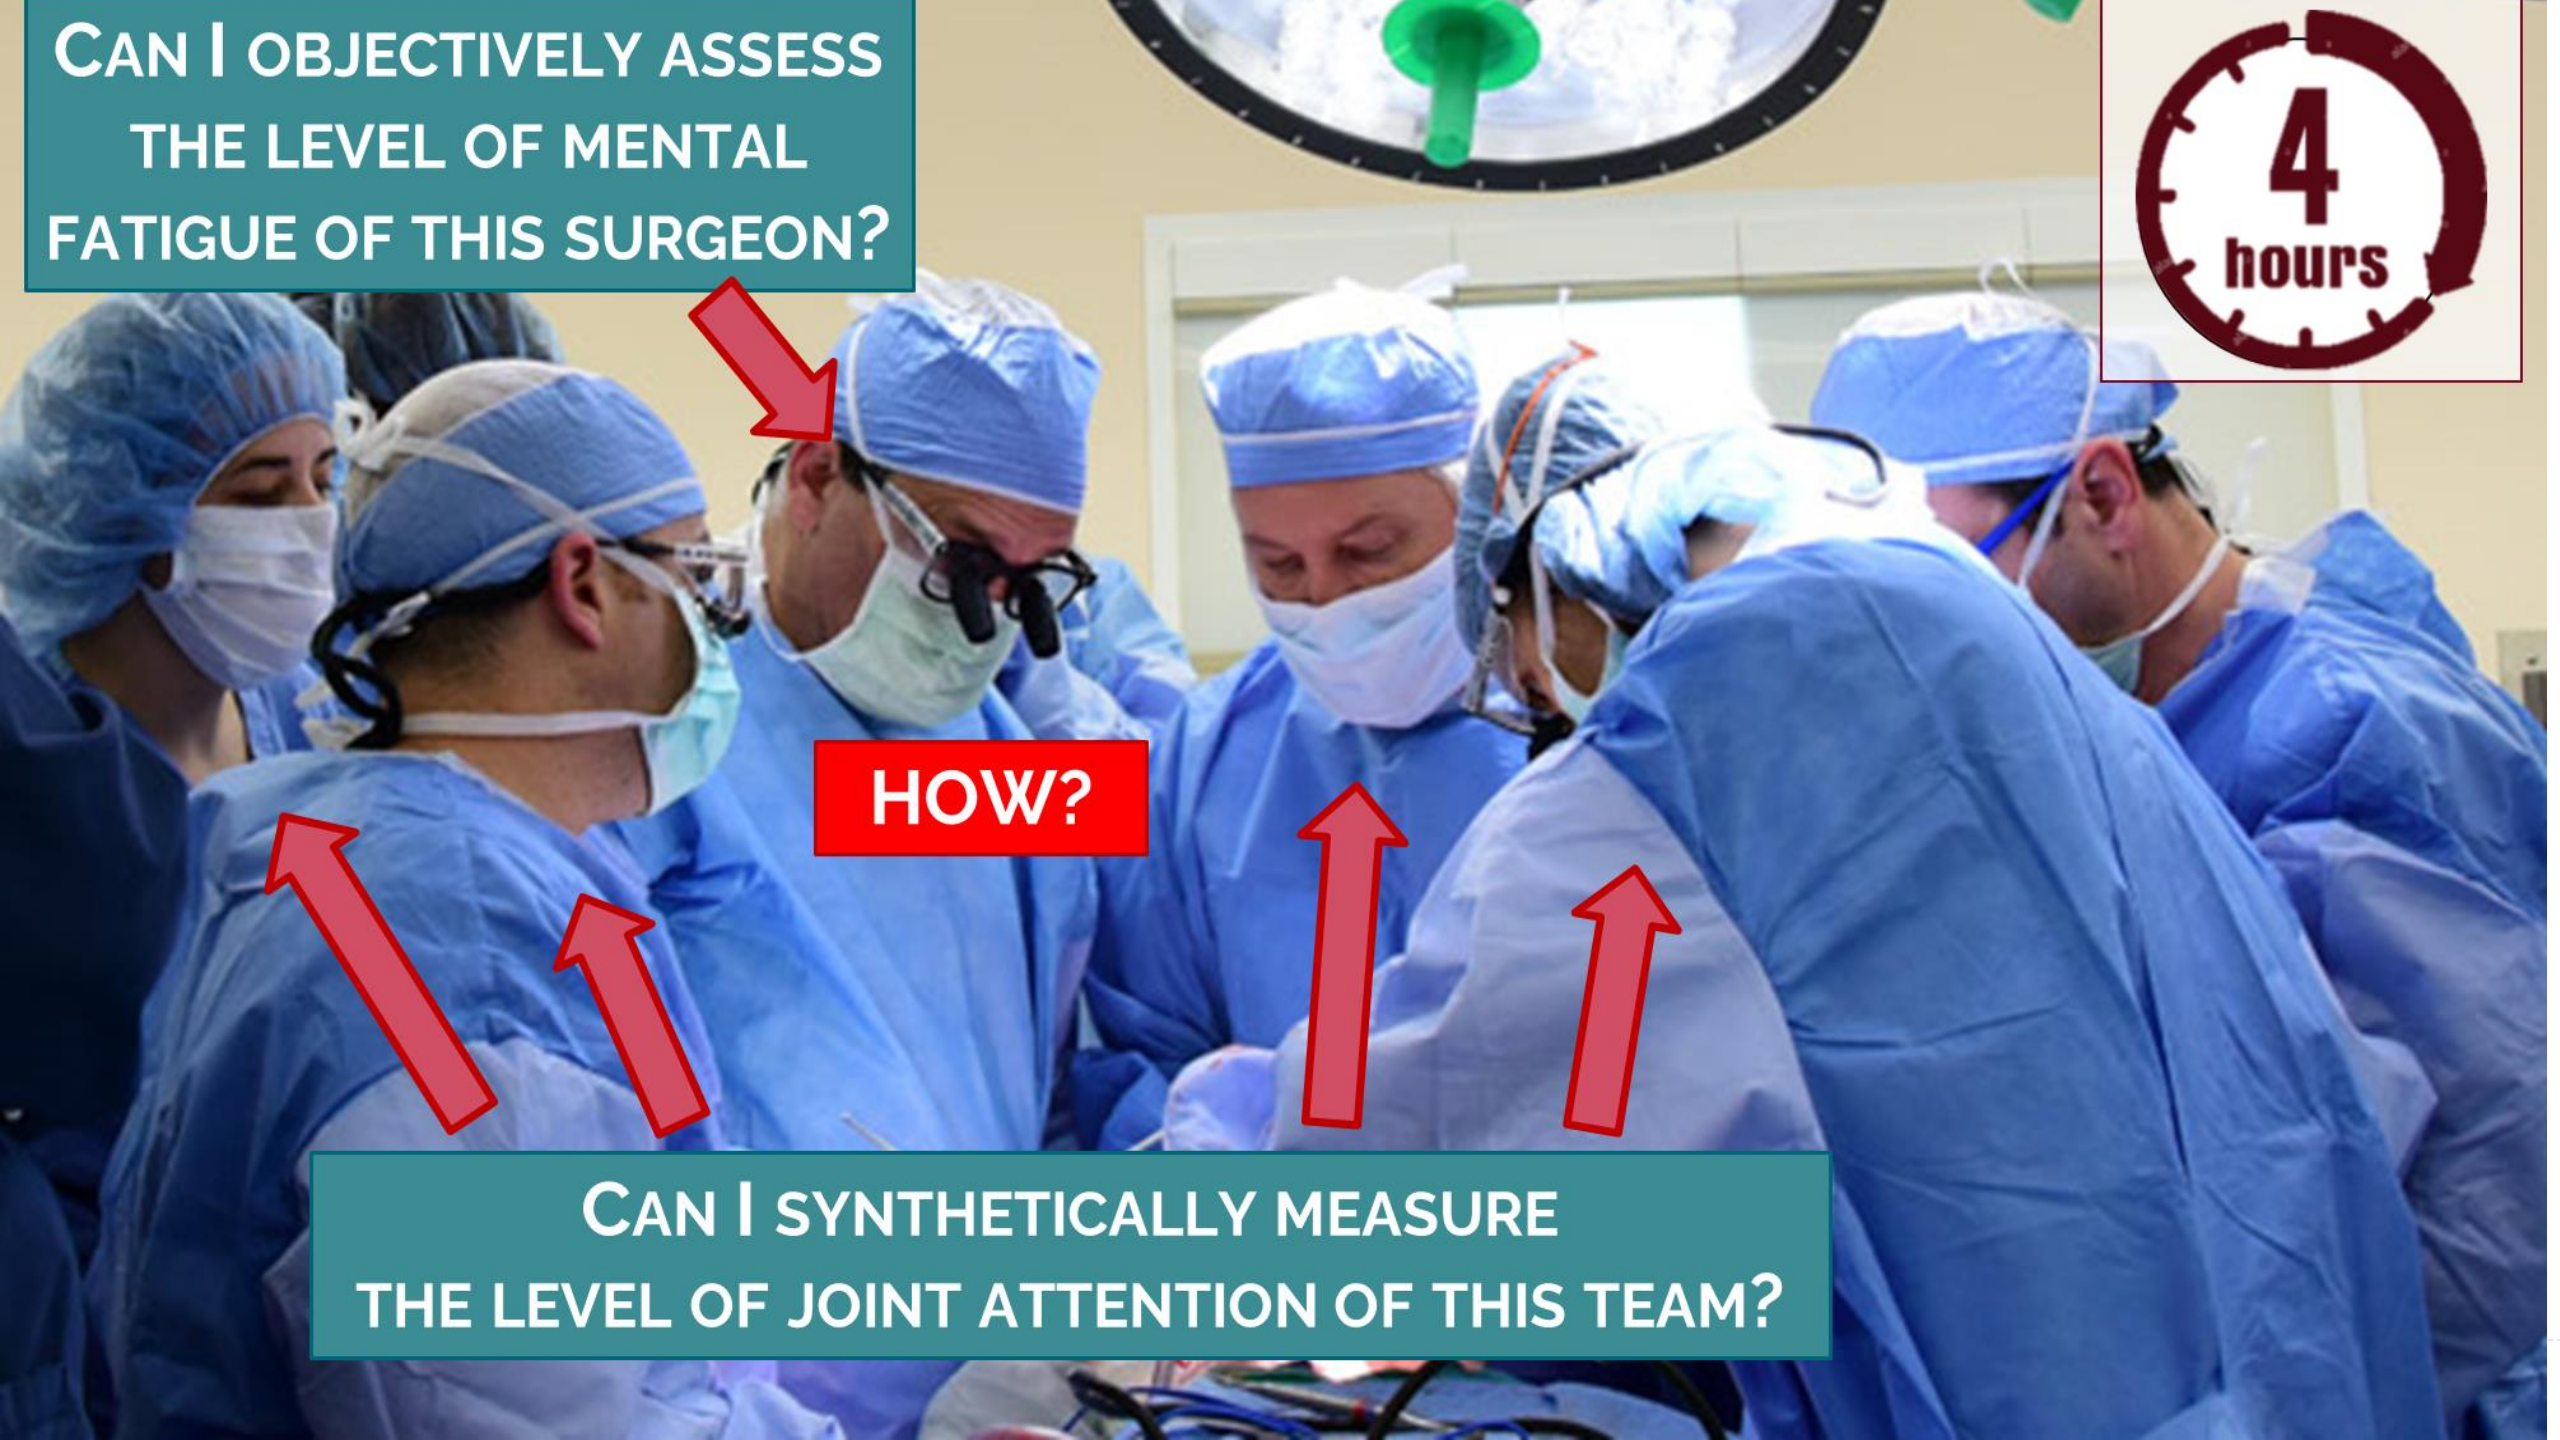

**CAN I OBJECTIVELY ASSESS
THE LEVEL OF MENTAL
FATIGUE OF THIS SURGEON?**

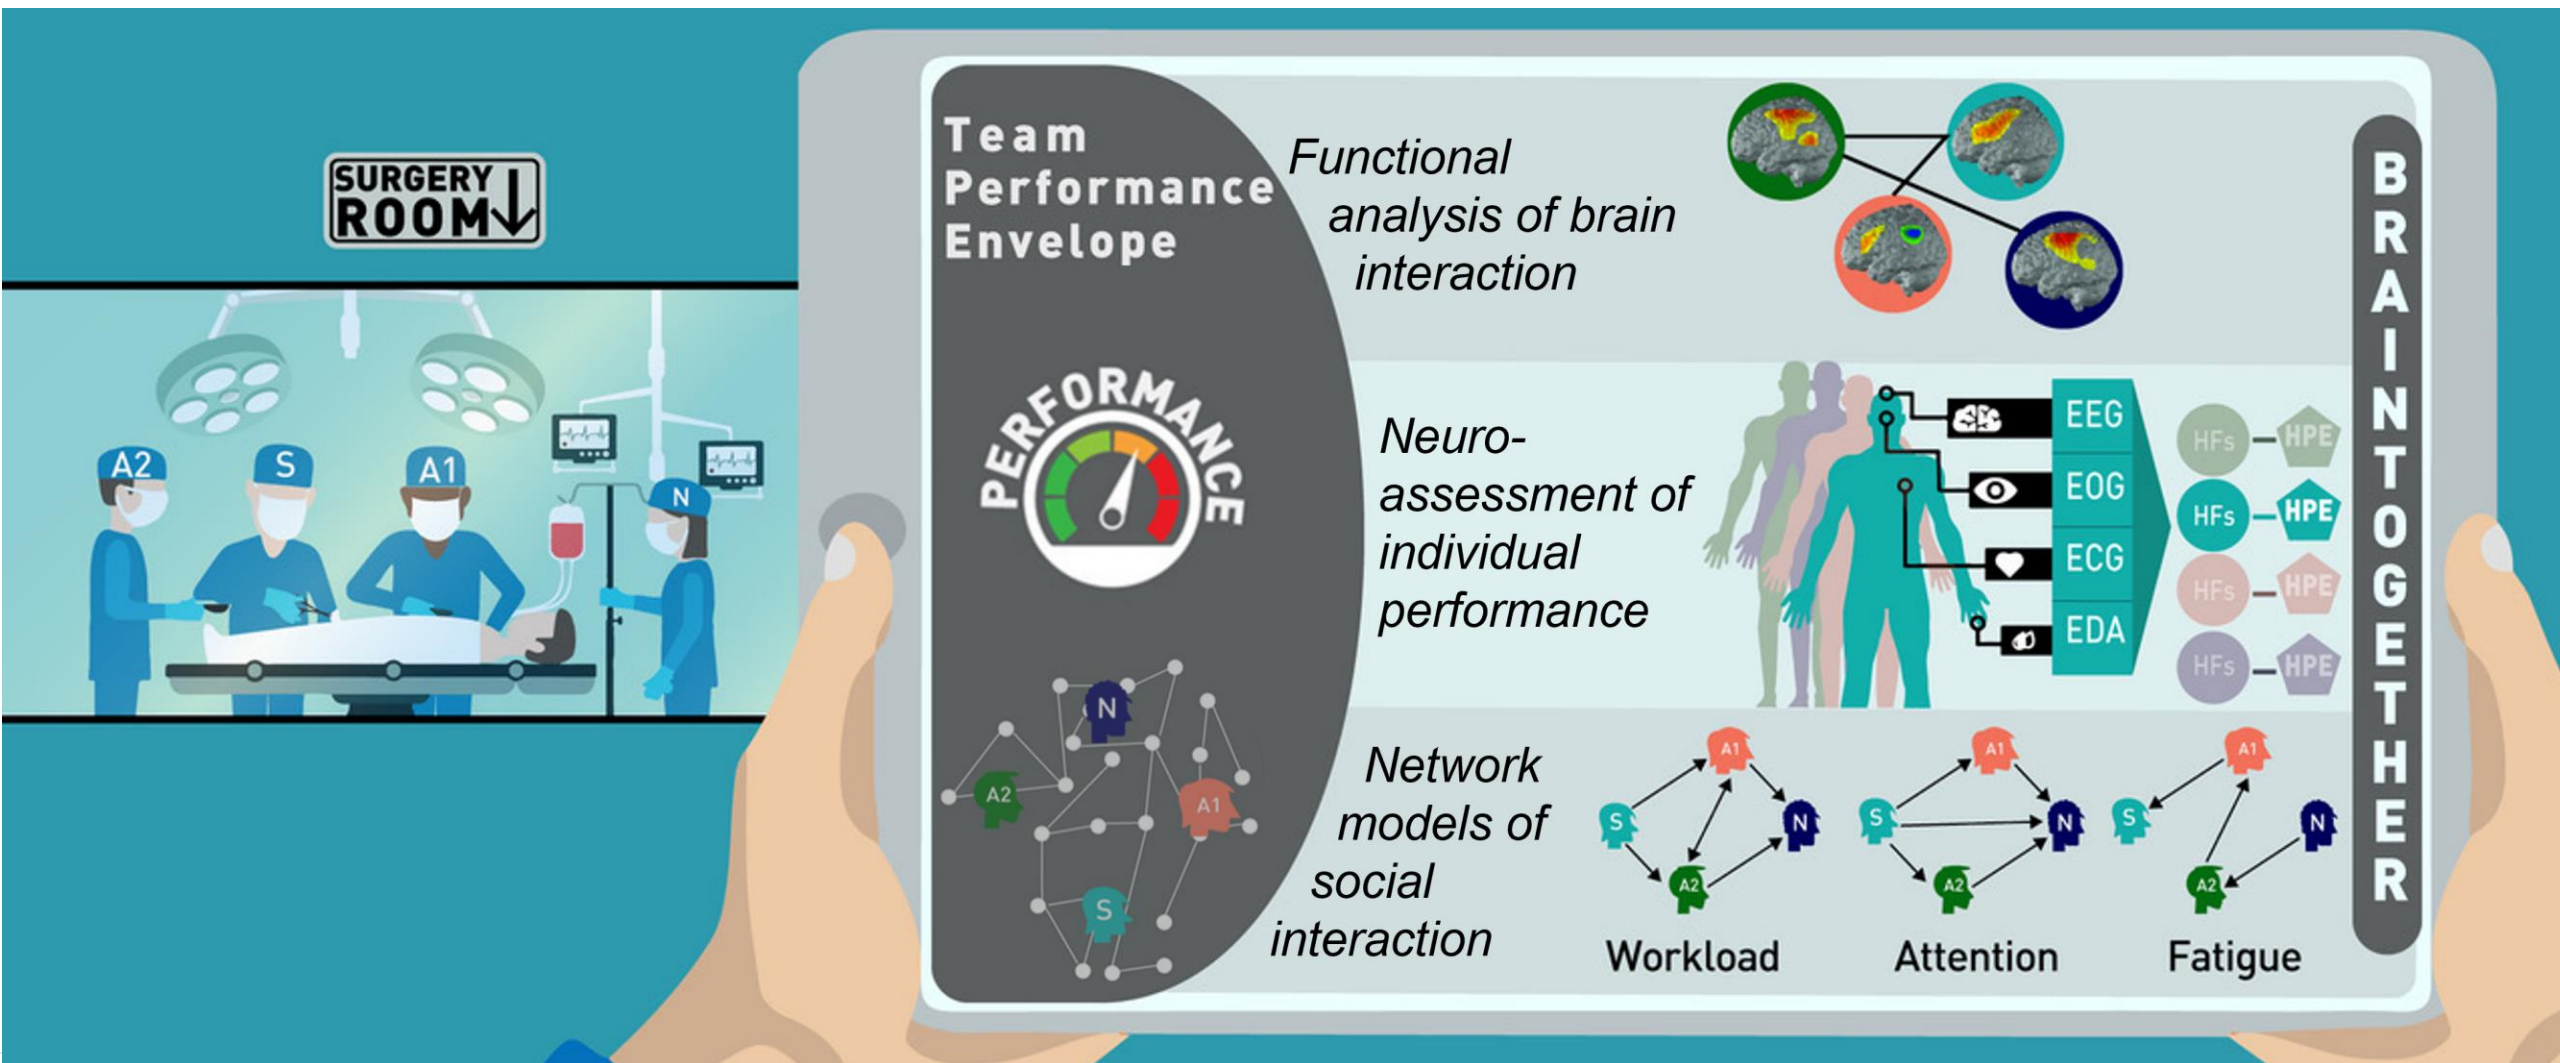

HOW?

**CAN I SYNTHETICALLY MEASURE
THE LEVEL OF JOINT ATTENTION OF THIS TEAM?**

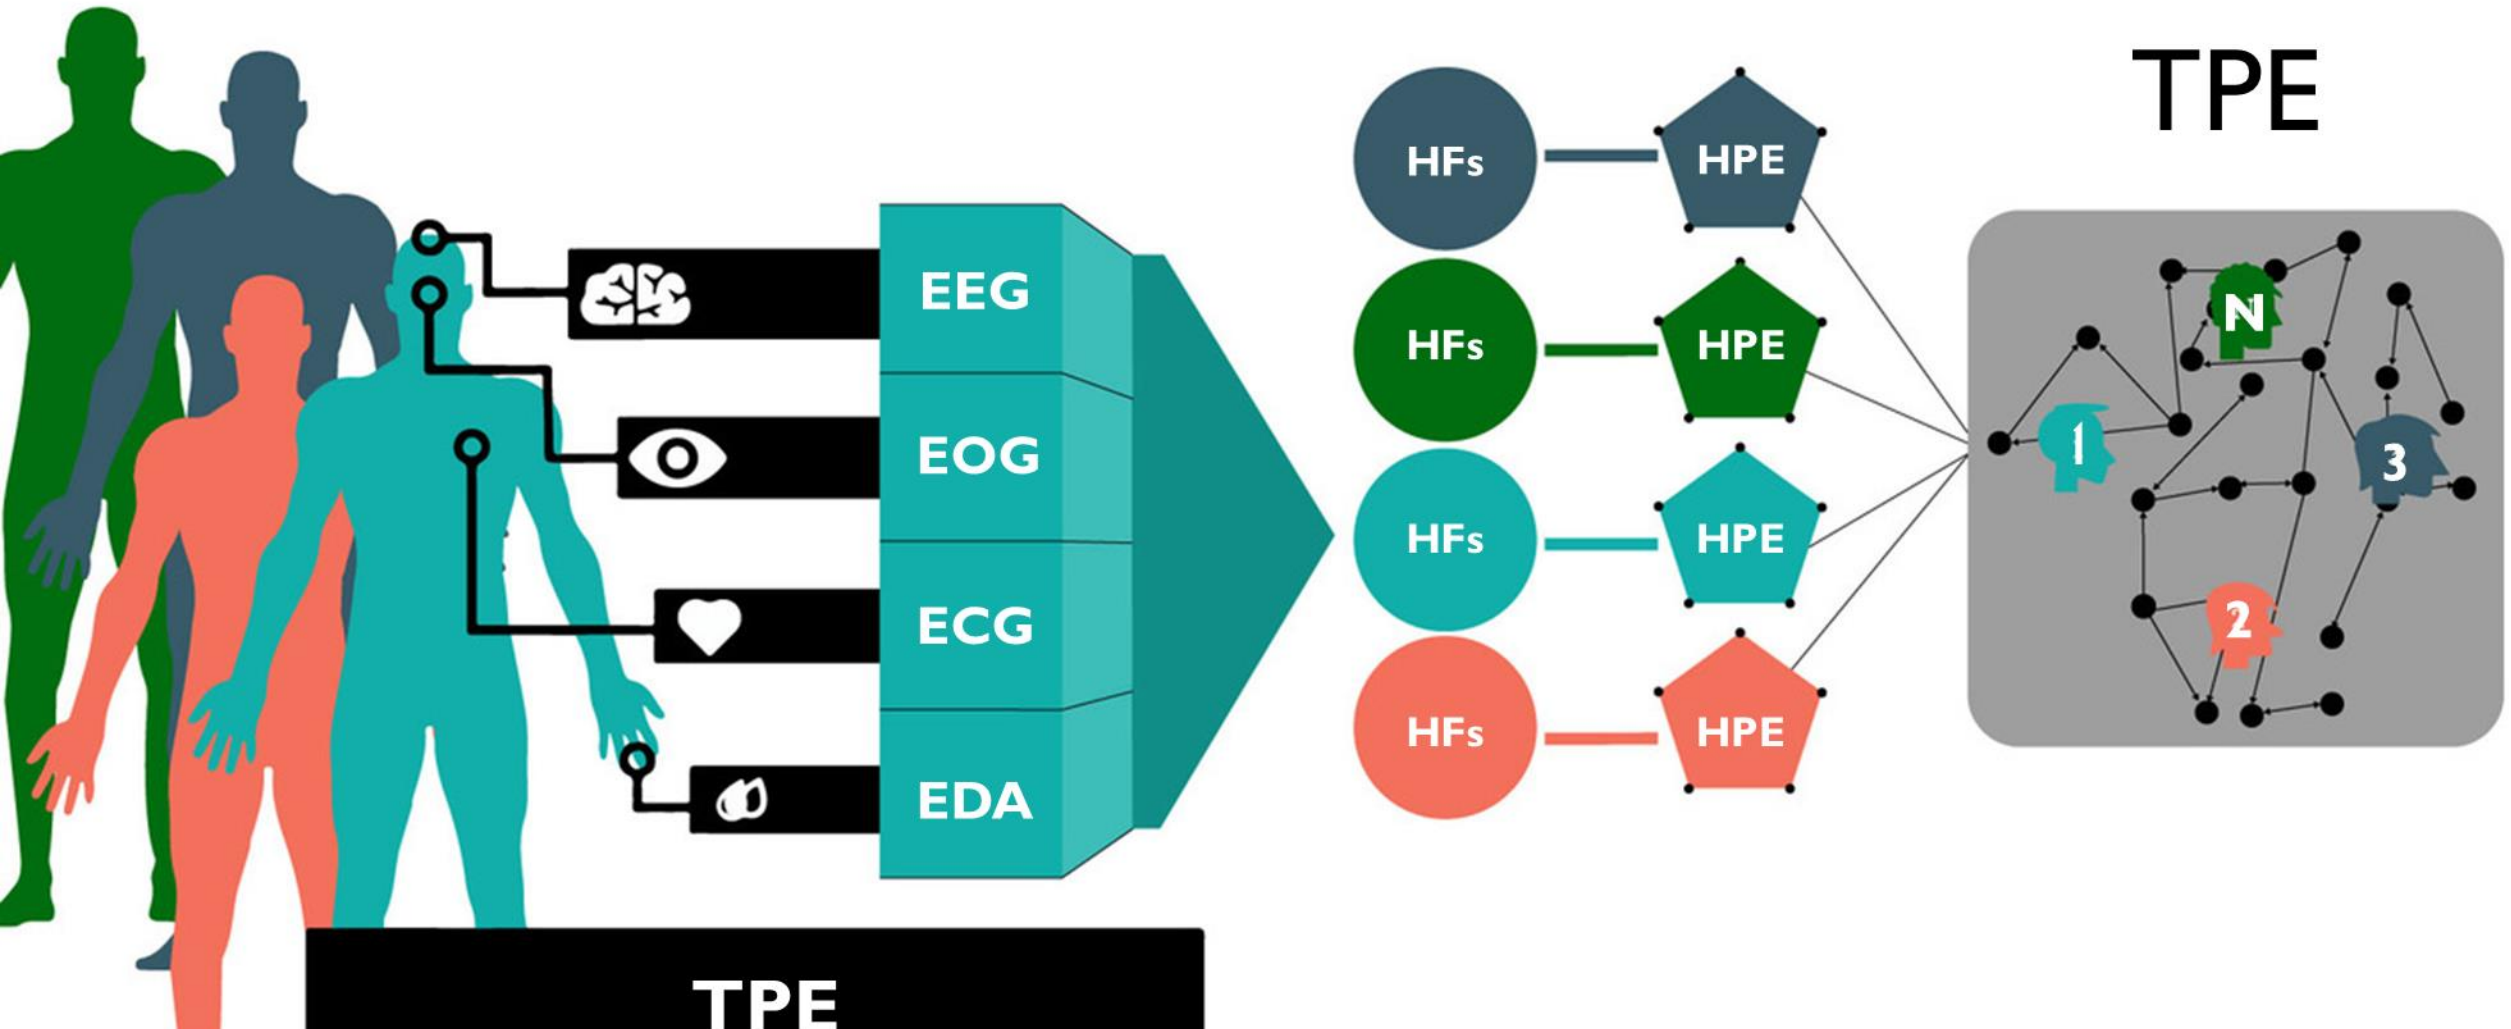

The measuring of team cooperation

Assessing in real time the mind states of astronauts and their degree of cooperation by neurometrics measurements

HOW?

CAN I OBJECTIVELY ASSESS THE DEGREE AND THE QUALITY OF THEIR COOPERATION?

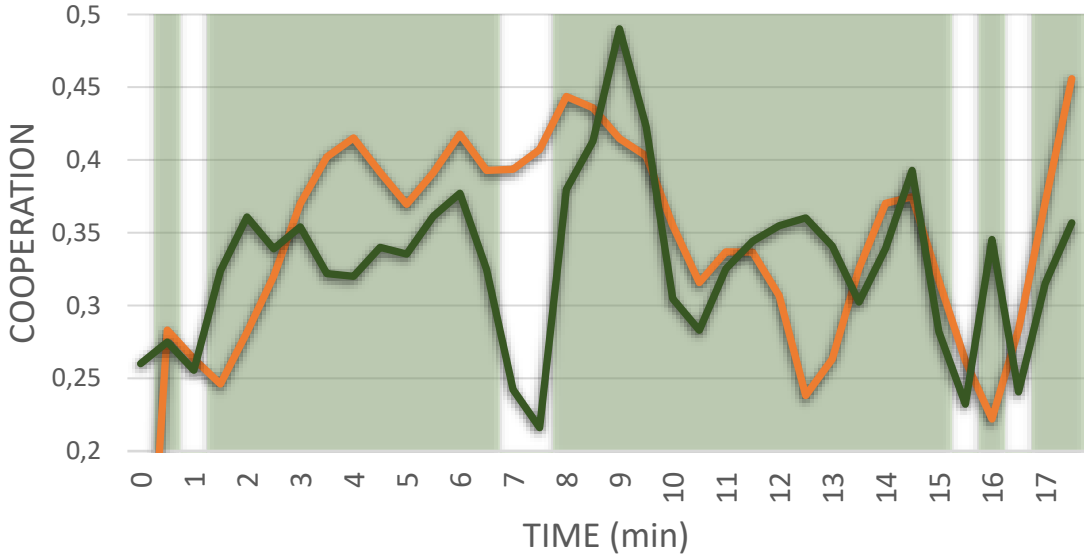

2018

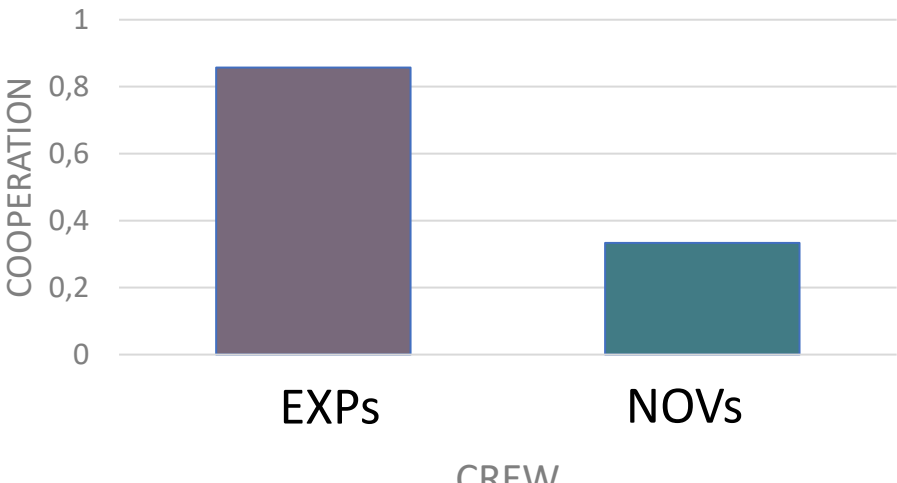

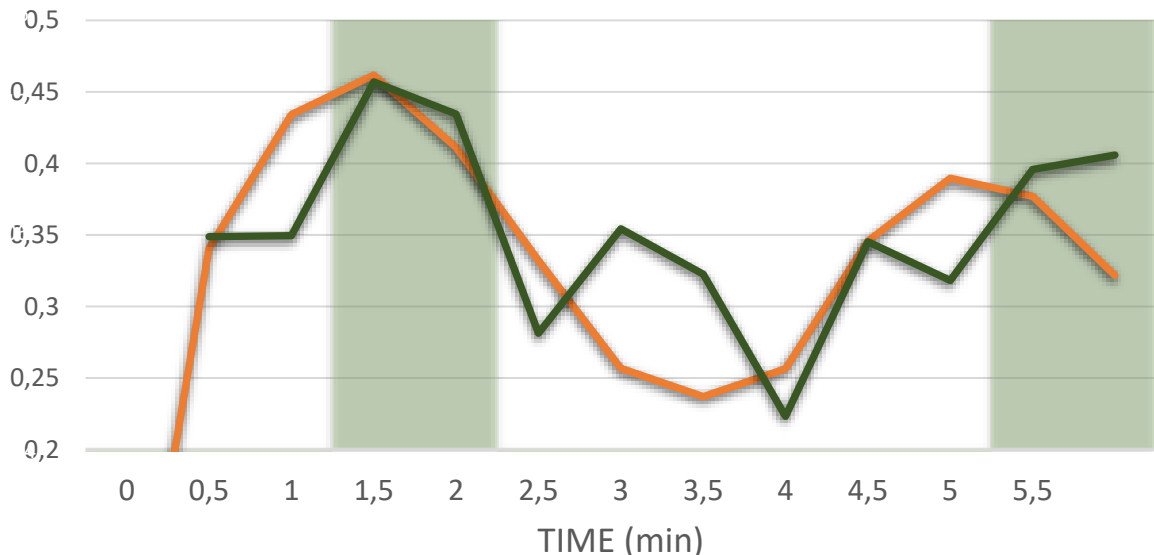

SAPIENZA
UNIVERSITÀ DI ROMA

Cooperation index correlation estimated during pilot's training

EXPERTS

NOVICES

- Behavioural
- Neurometric
- Neurometric class*

- ✓ The Cooperation index is correlated with the behavioural score assessed by the trainers (Average among pilots).
- ✓ Moreover The cooperation of Expert Pilots was higher than that one of Novices.

The measuring of team cooperation

The question is therefore not whether, but rather **when** and **how**, neuroscience will shape our future. (Martha J. Farah, TRENDS in Cognitive Sciences Vol.9 No.1 January 2005)
